Selection of user-defined control points and application of predefined curves. The predefined curves, which can be created via a graphical user interface, automatically adapt to the surface of the model. Optional modeling aids include the non-parametric option, which makes it possible to use points other than regular points of connection for smooth transitions. The solution from automatic surfaces processing does not rely on the "clipping surface" technique, which, however, also allows the incorporation of surface roughness. This solution also allows the use of predefined curves as marks, that is, as control points for the alignment of the surface parametrization to an existing standard. From the perspective of process automation the integrated processing of surfaces has significant advantages over non-automated surface processing. The product supports the calculation of highly complex surface models, such as highly. Automated repairs for broken and cracked surfaces are also supported. The solution is also suitable for parametrization of models with very complex surfaces and a large number of multiprocessing. The user-defined parametric curves that are created can be used in combination with spatial curves. Use in the design phase of a model facilitates the optimization of models by means of parametric surface. This makes the use of these surfaces possible in the BIM environment. I was very happy when I found this tool. It is really helpful. Thanks. Just one thing to be noted that it did not ask my license key to activate it. That was not a problem but it is really a major problem for me. So what I am going to do is firstly to contact product support and ask them to find a solution. If they fail then I am going to write a negative review on this site. What is Robot Structural Analysis Professional? There is no doubt that ROBOT is the best software for BIM in terms of quality. However, if you are an architecture student or the like you might be skeptical about how much use this application really has. Personally, I have to admit that before the acquisition of this software the only other tool I used for modeling was Revit. I don't know how it would be if you are a designer in the model field or if you have come across it but this software is only for professionals. Why is that? Well, f678ea9f9e
